I have a file which contains a list of directories, and I'd like to query this to get only the directories which have a certain subdirectory: Say I have a directory named test/a/b/c. I want to query this to return only test/a/b/c as the result, rather than the whole file. What query would I use in Sphinx to do this? A: Assuming you have your collection of data in a Sphinx index called test_data, something like this should get you started: index test_data { source = test path = /test/a/b/c charset = UTF-8 docinfo = extern mlock = 0 rtrees = yes rt_attr_uint = seq_id } searchd -c test_data -d test/ -q'subdirectory:a/b/c' -b 'query' -a 'test_data' 82157476af
